

Atrial Fibrillation +
A&D Technology

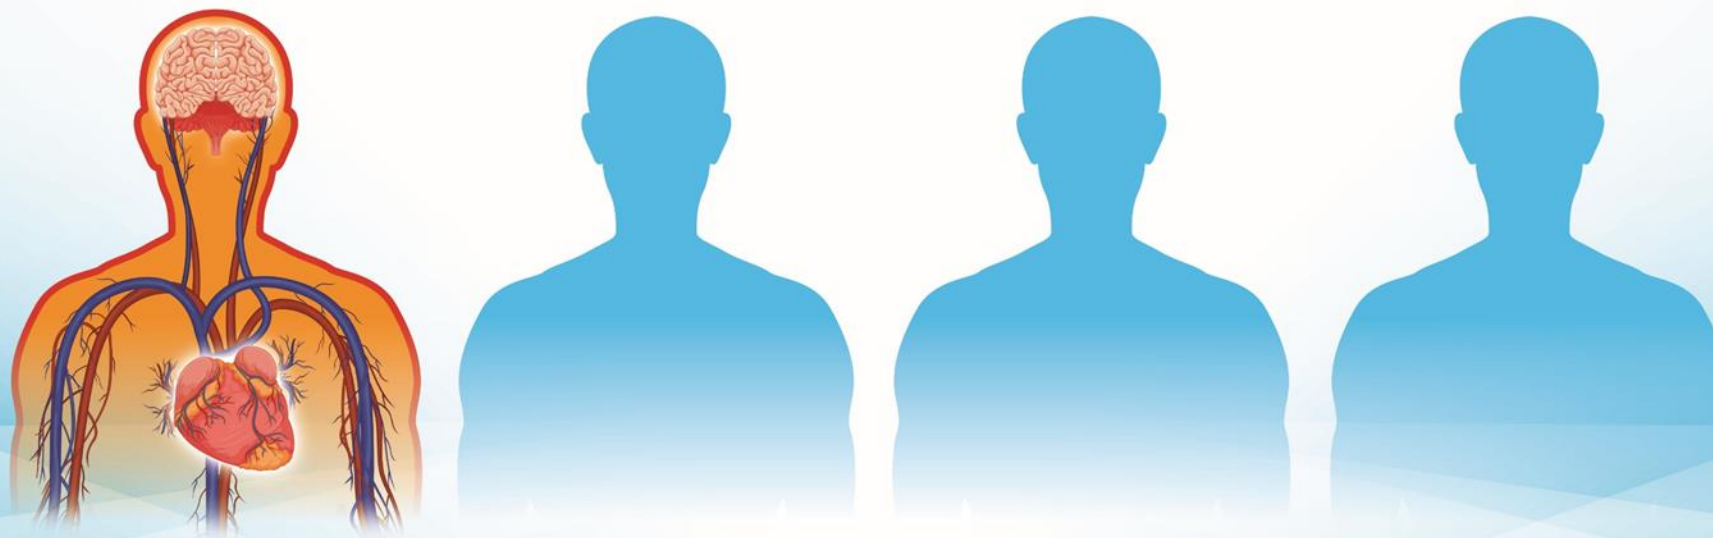

AFib+ Screening

A&D are committed to helping reduce the prevalence of strokes. People with Atrial Fibrillation are 5 times more likely to suffer a stroke. Yet 66% of AFib strokes can be averted with treatment.

A&D's unique AFib+ technology provides a screening tool for both an Irregular Heart Beat (IHB) and Atrial Fibrillation (AFib). This technology is now available on the latest range of blood pressure monitors.

Atrial Fibrillation Prevalence

- 1.4 million people have AF
- 1 in 4 people with AF are undiagnosed
- 66% of AF strokes can be averted with treatment
- 20% of all strokes linked to AF
- 62% not prescribed anticoagulant
- People with AF x5 higher risk of stroke

* Public health England published Feb 2017

Atrial Fibrillation and Stroke

- Relation between high blood pressure and stroke
- Hypertension number 1 risk factor of stroke
- Importance accurate blood pressure measurement
- Focus of the high accuracy of BP measurement by A&D Medical, our heritage + clinical validation
- Second risk factor of stroke is atrial fibrillation.
- A&D have unique AFib detection (one measurement) to screen for detection e.g. atrial fibrillation.

New Technologies

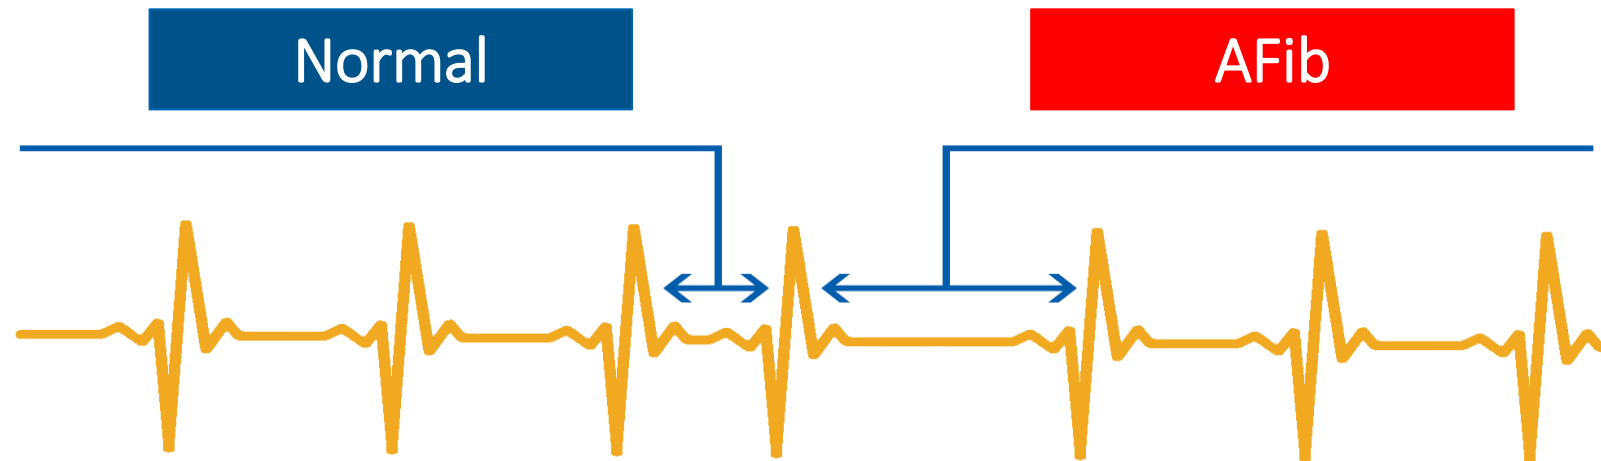

A&D AFib+ technology

The ability to screen for both IHB and AFib

A&D SmartCheck technology

100% Accurate Detection in a Single Measurement²

AFIB² symbol appears when the recorder detects an irregular heartbeat that differs $\pm 15\%$ from the average pulse rate.
